The Great Trinity Forest Management Plan

Volume 5
Stand and Stock Tables

GREAT TRINITY FOREST

Stand and Stock Tables

Tables describing the live tree structure of the forest.

Volume 5

Live tree stand and stock tables were created from the Forest Vegetation Simulator and forest inventory data. The tables describe each forest unit by species and are shown in 10-year increments. A unit summary statistics report is included at the beginning of each unit's section.

Summary Statistics Table

Terms and Methods Defined

Overview

Summary statistics were calculated for each forest unit at the time growth and yield models were run. The figures are displayed for each 10 year period and one year following the treatment and planting of a stand.

The following defines the descriptive statistics for each stand:

QMD – Quadratic Mean Diameter

The Diameter at Breast Height (DBH) associated with the mean Basal Area per tree. QMD is very useful to use in conjunction with basal area per acre and trees per acre when making forest management decisions. It is calculated by taking the square root of Basal Area per Acre (BAA) divided by Trees per Acre (TPA) and the constant 0.00545415:

$$QMD = \sqrt{\frac{BAA}{TPA}/0.00545415}$$

TPA – Trees Per Acre

Trees per acre is the average number of total trees per acre.

BA/A – Basal Area Per Acre

Basal area is measure of stand density that is the total square foot cross sectional area measured at 4.5 feet above ground on the uphill side of all trees per acre. The individual basal area of a tree can be calculated by using the following formula :

$$\text{BA}_{\text{per tree}} = DBH^2 \times 0.00545415$$

Top Ht. – Top Height

Top height is the average height in feet of the 40 largest diameter trees.

SDI – Stand Density Index

Stand density index is a measure of stand density based on trees per acre and QMD. Because it is a function of QMD and trees per acre it is more sensitive to variances in diameter class distributions and can be used to distinguish between stands that could have similar basal areas but vary in size class. SDI maximums and minimums vary by species and forest type.

CCF – Crown Competition Factor

Crown competition factor is another measure of stand density that is based in tree diameters. CCF represents the percentage of an acre that is covered by tree crowns. A CCF of 100 would theoretically indicate that tree crowns will just touch in an unthinned, evenly spaced, stand.

MAI – Mean Annual Increment

The mean annual increment is the average annual growth of merchantable material in cubic feet up to the measured point in time.

Management Unit 2021

39.5 acres

Summary Statistics *Planting Year: 2021*
